

*A1
concl.*

setting means for setting the communication network to activate call forwarding such that incoming call for the communication apparatus is forwarded to the calling party of the identification information received by said reception means,

wherein an incoming call, which will be detected at the communication apparatus after the setting by said setting means, is forwarded to the calling party of the identification information by the communication network.

A2

15. (Amended) A method of controlling a communication apparatus connectable to a communication network, comprising:

a reception step of receiving identification information of a calling party notified from the communication network when an incoming call is detected; and

a setting step of setting the communication network to activate call forwarding such that an incoming call for the communication apparatus is forwarded to the calling party of the identification information received in said reception step,

wherein an incoming call, which will be detected at the communication apparatus after the setting in said setting step is forwarded to the calling party of the identification information by the communication network.

A3

29. (Amended) A program storage device readable by a machine tangibly embodying a program method of instructions executable by the machine to perform method steps for forwarding to a communication apparatus connectable to a communication network, said method steps comprising:

a3 cond.
a reception step of receiving identification information of a calling party notified from the communication network when an incoming call is detected; and

a setting step of setting the communication network to activate forwarding of a call such that an incoming call for the communication apparatus is forwarded to the calling party of the identification information received in the reception step,

wherein an incoming call, which will be detected at the communication apparatus after the setting in said setting step, is forwarded to the calling party of the identification information by the communication network.

Please add new Claim 30 as follows:

a4
30. (New) A communication apparatus connectable to a communication network, comprising:

detection means for detecting an incoming call notified from the communication network;

reception means for receiving information designating forwarded to site via the communication network when the incoming call is detected by said detection means; and

notification means for notifying the communication network of the information such that an incoming call to the communication apparatus is forwarded to the forwarded-to site designated by the received information,

wherein an incoming call, which will be detected at the communication apparatus after the notification, is forwarded to the forwarded-to site by communication network.
